

Adding the eNamad Trust Badge

Step by Step — Kalaland24 (kalaland24.com)

For when your enamad.ir verification is approved. No developer needed — just follow this.

1. Get your badge code from eNamad

- 1 Log into your account at **enamad.ir**.
- 2 Once your site is approved, go to your dashboard and find the button for getting your trust seal code (labeled in Persian, roughly “Get trust seal code”).
- 3 eNamad gives you an HTML snippet that looks like this (yours will have different numbers):

```
<a referrerpolicy='origin' target='_blank'
href='https://trustseal.enamad.ir/?id=123456&Code=aBcDeFgHiJkLmNoP'>
<img referrerpolicy='origin'
src='https://trustseal.enamad.ir/logo.aspx?id=123456&Code=aBcDeFgHiJkLmNoP'
alt='' style='cursor:pointer' code='aBcDeFgHiJkLmNoP'>
</a>
```

Copy your own version of this exact snippet somewhere safe — you'll need the two numbers/codes from your href and src in step 2.

■ Do not edit or “clean up” this snippet. eNamad's verification system checks the exact id and Code values, and their own badge image is dynamic (it can show “not verified” if the site domain doesn't match). Copy it exactly as given.

2. Add it to the website

Open this file:

```
src/components/layout/Footer.tsx
```

Find the “**social**” column (around line 26–67) — it already has WhatsApp, Telegram, and Rubika icons in a `<div className="flex gap-4 mt-2">`. Add the eNamad badge as a new block right after that closing `</div>` and before the closing `</div>` of that column, like this:

```

<div>
<h4 className="font-semibold mb-3">{t('social')}

```

Replace 123456 and aBcDeFgHiJkLmNoP in **both** the href and src with your real values from step 1. The alt text shown above is in English for this PDF (to keep the file's font simple) — in your actual code you can write it in Persian instead, e.g. the Persian phrase for “e-trust certification badge,” whichever you prefer.

Why a plain `<img>` and not Next.js's `<Image>`?

Next's `<Image>` component proxies/resizes images through its own optimizer. eNamad's badge image is dynamically generated by their server (and can change to show “unverified” if something's wrong), so it must be loaded directly from `trustseal.enamad.ir`, not proxied. The `eslint-disable` comment just silences the linter warning for using a plain `<img>` here — that's expected and fine for this one case.

3. Deploy

From the project folder:

```

git add src/components/layout/Footer.tsx
git commit -m "Add eNamad trust badge to footer"
git push

```

Vercel will auto-deploy in about a minute (same as every other push).

4. Verify it worked

- 1 Open **kalaland24.com** and scroll to the footer — the badge image should appear.
- 2 Click it — it should open a new tab on `trustseal.enamad.ir` showing **your site's name and domain** as verified. If it shows an error or “not found,” double-check the `id/Code` values match exactly what eNamad gave you (no extra spaces, no typos).
- 3 Check on mobile too (the badge sits in the same column as the social icons, so it should stack naturally — no extra CSS should be needed, but glance at it once on a phone).

If something looks off

- **Badge shows a red/broken icon:** usually means the `id` or `Code` value has a typo, or your eNamad approval isn't fully processed yet on their end (can take a few hours after approval).
- **Badge shows but clicking it goes to an error page:** same — double check the `href` matches exactly what eNamad gave you.
- **Want it somewhere else on the page** (e.g. its own row, or also on the homepage): the same `<a>/<img>` block can be pasted anywhere — it doesn't depend on anything else in `Footer.tsx`.
